

Facts in the middle. Dimensions around them.

Wh* tables. Loaded by mart-rollup. Never take a card charge here.

Snowflake: WhDimMember.planKey -> WhDimPlan. Star otherwise. Conform date + plan + landing across facts.

OLTP in. Star out. Same Postgres, different tables.

SOURCE (OLTP)

AnalyticsSession + AnalyticsEvent
User + MemberProfile
FactSubscriptionPayment (already a ledger)
MartDailyMetrics stays as a cube snapshot
Checkout / Stripe webhooks do not insert Wh*

LOAD

src/lib/warehouse-load.ts
Hooked from mart-rollup (daily 07:00 UTC)
Idempotent upserts on source ids
Pacific iso date -> dateKey
First run seeds 2026 dates + plan/landing dims

QUERY EXAMPLES

A vs B sessions: GROUP BY landing.letter WHERE date.month = 9
Coach upgrade funnel: signups plan=member vs upgradeRequests vs payments plan=business
Paying vs grant: payments.method = stripe vs member.plan from staff grant (no payment fact)
Do not hot-poll these tables faster than 5s — same Postgres as the app.

Keep the gym app and the warehouse from becoming one blob.

NOT IN THE WAREHOUSE

Card data (Stripe hosted Checkout)
Password hashes
Chat bodies
BYOW raw notes
Venmo QR (retired)

STILL OLTP

MemberProfile.plan is live access
BusinessUpgrade* columns drive the button
Acct* books are GL, not star facts
MoneyDeskSettings is ops, not a dimension
